

Driehaus Small/Mid Cap Growth Strategy Summary

4TH QUARTER 2022

Market Overview

The December quarter was a relatively stable period compared to the first three quarters of 2022 as the market largely churned and consolidated with slightly positive gains. Market participants continued to be glued to inflation, economic data and of course every move made by the Federal Reserve. While inflation has eased month to month, progress has not been enough to change the Fed's hawkish stance on rates and monetary policy. Economic growth continued to slow but the Fed is very focused on the labor market (and wage inflation) which remained tight as new job creation sustained each month and unemployment persisted near multi-decade lows. This "good news" remains "bad news" for equities as it puts more pressure on the FOMC (Federal Open Market Committee).

While equities did make gains for the fourth quarter, that did little to erase a very difficult year for the US equity market. 2022 was the worst year for US stock returns since the GFC (Global Financial Crisis) (2008) and rivaled historical negative periods such as the post-Nasdaq Bubble period of the early 2000s and great bear market of 1973-1974.

The current bear market has been painful, but its reasons are straightforward. The extremes of the Covid pandemic fueled the highest level of inflation in decades. That inflation drove extremely hawkish Federal Reserve monetary policy. That hawkish policy, intended to reduce inflation, has resulted in an economic slowdown, a potential recession and has put pressure on corporate earnings. This dynamic has been very negative for investor sentiment and in turn for equity multiples which have fallen sharply since the market highs in 2021.

The equity market outlook remains dependent on inflation and therefore Fed policy. We continue to see inflation primarily driven by:

- Excess money (M2 grew nearly 27% year-over-year at its height in 2021)
- Excess saving (like after World War II) caused by rising wages, full employment and in the current case stimulus payments, drove excess demand.
- Supply chains (Covid caused many global supply chain issues and bottlenecks which limited supply)
- Labor shortages (Covid, for multiple reasons, caused labor shortages which exacerbated supply issues)

Where do we see these causes of inflation now?

- M2 is now negative on a year-over-year basis. Just as it was a key driver of inflation, we believe falling M2 will significantly subdue inflation.
- Excess savings - its level continues to fall. This is reducing the level of demand for goods and services and therefore the prices paid. After WWII, excess savings rose to extreme highs which fueled inflation. As excess savings fell, so did inflation. We believe the current environment is similar with falling savings putting downward pressure on inflation. As an example, durable goods inflation is already falling sharply.

Driehaus Small/Mid Cap Growth Strategy

- Supply chains have largely recovered, which has improved the overall level of supply. Of course, some supply chain issues do remain. It varies by industry and geography (semiconductor shortages in the auto industry is one example). However, overall supply chains have recovered. As a result, many industries have normal to even elevated inventories, a major change from 12-18 months ago.
- Labor shortages remain the biggest wildcard. Labor markets remain tight. Jobless claims are rising but the US unemployment rate remains at multi-decade lows. The Fed is intensely focused on this as it wants to see slack in the labor force which will ease wage inflation. Despite full employment, recently wage growth has begun to slow.
- There are other factors as well. The trend away from globalization is a major one with uncertain outcomes. Globalization was a major source of disinflation, and de-globalization may create some inflationary pressures. Other key factors, such as technology, the Internet, automation, and aging populations are all arguably disinflationary, and we believe those trends remain persistent.

So, while we believe inflation will continue to fall, the trajectory of inflation, month by month and versus expectations, may be uneven and may take time to normalize. Some inflation inputs such as housing and rent inflation fall on a long lag due to how they are measured. Other inflation factors such as energy costs fall more in real-time. The Fed wants to see multiple months of evidence that inflation is clearly on the right path. The Fed is data dependent and in the coming months it should adjust to the easing inflation data. As the Fed adjusts it will likely announce smaller rate hikes, reach its target neutral rate, and eventually pause rate hikes all together.

As inflation eases and the Fed normalizes its monetary policy, it will have a positive impact on equity investor sentiment and on equity multiples. Uncertainty remains very high, but we believe this period of uncertainty offers opportunity. A lot of bad news is currently priced in. Current valuations are at levels consistent with or at levels below past recessions.

Please note the charts below. Chart 1 (Exhibit 1) shows the Russell 2000 small cap P/E multiples over time with the current valuation level at the bottom of its long-term range. Chart 2 (Exhibit 2) shows the deep discount small caps currently trade at relative to large caps. It is the second lowest relative valuation to large caps in the past forty years.

Exhibit 1: Small Caps Remain Historically Cheap vs Large Caps

Small cap forward P/E well below the long-term average
(Russell 2000 Forward P/E, 1985-12/31/2022)

Small caps remain historically cheap vs. large caps
(Relative Forward P/E: Russell 2000 vs. Russell 1000, 1985-12/31/2022)

Driehaus Small/Mid Cap Growth Strategy

We have studied how equities bottom over time during other high inflationary periods. As we wrote a quarter ago, equities typically bottom when inflation peaks. This occurred in 1970, 1974, 1980 and 1990. Also, equities typically bottom before earnings do. Since the market is a forward-looking discounting mechanism, looking at several decades of data, equities typically bottom ahead of the low in consensus earnings. One bear argument we frequently hear is the market has another leg down since earnings may get worse. This is possible, but if inflation continues to head lower, we believe it is likely we will see stock multiples stabilize and even rise as the market has likely already discounted earnings getting worse. The final key variable to consider is how does the equity market behave going into a recession. Historically, equities bottom during a recession. So, while inflation peaking is a needed check mark, the other necessary variable is an economic bottom. From an equity perspective, the widely anticipated recession could actually be a welcome sign, as it is finally here and is potentially expected and discounted. The depth of any recession of course matters.

Entering 2022, it seemed like the consensus call was that the US economy would enter a recession. While US economic growth has slowed, most economic indicators suggest the US has not entered a recession yet. Looking into 2023, the odds of a recession are much higher. Several reliable recession indicators suggest a recession will likely be upon us in the near-term: (1) a very high percentage of the US treasury yield curves are inverted, (2) LEIs (Leading economic indicators) have fallen sharply and are consistent with a recession and (3) ISM manufacturing and services readings are now both well below 50, suggesting a contraction.

Despite that evidence, a couple key indicators are not consistent with a recession. First, the labor market while starting to weaken is still strong. Second is credit availability. It is getting less available in certain segments, but overall credit conditions remain surprisingly benign. The credit markets are not yet signaling a credit crunch or crisis. It is possible we have a (mild) recession without these two key ingredients, as labor and credit, remain benign. It is also possible that we have already had a series of rolling recessions across various segments of the economy as opposed to a full traditional recession.

Performance Review

For the December quarter, the Driehaus Small/Mid Cap Growth strategy underperformed its benchmark. The Strategy gained 0.50%, net of fees, while the Russell 2500 Growth Index gained 4.72%.¹ By comparison, the Russell 2500 index appreciated 7.43% and the large cap S&P 500 rose 7.56%. It was a quarter where value outperformed growth, and larger caps outgrew smaller caps.

For the full calendar year, the Driehaus Small/Mid Cap Growth strategy underperformed its benchmark. The Strategy declined 31.40%, net of fees, while the Russell 2500 Growth Index declined 26.21%. By comparison, the Russell 2500 declined 18.37% and the S&P 500 declined 18.11%. Size and value outperformed for the full year.

Our full year investment performance was disappointing to us. It was one of the worst absolute years for US equity returns in market history. The market dynamics were challenging, characterized by bearish macro factors, weak market breadth, extreme industry and stock rotation, and individual company earnings that were generally not rewarded by the market as they typically are. Regardless, the team and I were not satisfied with these results. We pride ourselves on consistent outperformance. The Driehaus Small/Mid Cap Growth strategy had outperformed its benchmark, on a full calendar year basis six of the past seven years.

¹The performance data represents the strategy's composite of small/mid cap growth accounts managed by Driehaus Capital Management LLC (DCM) (the composite). These returns are estimated for the period as the underlying accounts' data is yet to be reconciled to the custodian bank. Net of fee returns reflect the payment of advisory fees and in some instances, other fees and expenses such as administrative and custodian fees while the gross of fee returns do not. Both are net of brokerage commissions charged to the accounts and reflect the reinvestment of income and other earnings. The performance data shown above represents past performance and does not guarantee future results. Current performance may be lower or higher than the performance data quoted.

Driehaus Small/Mid Cap Growth Strategy

Healthcare

Healthcare outperformed by 132 basis points versus the benchmark. The strength was across the whole sector and led by biotech and pharma. Our biotech holdings gained nearly 10% versus 2% for the benchmark. Biotech performed well for the second half of the year following a long bear market decline from February of 2021 through June of 2022. We remain quite encouraged with clinical trial updates and outlooks for our therapeutic holdings. We anticipate 2023 will be a promising year for them as various clinical trials demonstrate successful outcomes. We maintain an overweight to biotech.

Healthcare was reduced during the quarter from 20% of the portfolio to just under 18%. This decrease was due to trimming and selling a few positions in medical devices.

Technology

Technology underperformed by 130 basis points. Telco equipment outperformed due to strong earnings reports, but this was offset by broad weakness in software and some underperformance in semiconductors. Overall, we increased exposure to the sector during the quarter with increases in telco equipment and semiconductors.

Consumer Discretionary

After outperforming nicely in the September quarter, consumer discretionary was difficult and was the portfolio's largest detractor, underperforming by 65 basis points. Slowing consumer spending and fears of further slowdowns ahead of a potential recession caused multiple holdings to trade lower after their quarterly results.

Industrials

Industrials underperformed by 175 basis points. We had several holdings perform well across several sub-industries with strong earnings. However, a top ten holding fell materially after proposing to acquire a complimentary peer business. The acquisition, while accretive in year one, is relatively large in size and will increase leverage on the company's balance sheet.

We have increased exposure to the industrial sector and maintain an overweight as we see industrials as arguably the strongest sector looking ahead. Several themes make the sector appealing. One is "reshoring" which we believe is a powerful trend. After multiple decades of moving manufacturing and supply chains overseas that process is now being reversed. Due to headaches from Covid led supply chain disruptions and uncertain behavior by China, many companies are in the process of "reshoring" large parts of their manufacturing and supply chains back to the US. Additionally, multiple very large federal stimulus programs offer big opportunities for US companies. These include programs worth well over \$1 trillion such as new infrastructure spending, the Inflation Reduction Act, Rural Broadband Spending programs and the Chips Act to name just a few. We see multiple sub-industries and individual companies that should benefit, including engineering & construction, infrastructure companies, automation companies, machinery companies, EV (electric vehicle) suppliers, specialty material companies and renewable/clean energy companies.

Energy

Energy continued to be very volatile, detracting 50 basis. It was the market's best performing sector for the year but sold off sharply from June to September before sharply recovering in October. The sector's volatility has been driven by the sharp swings in the prices of crude oil and natural gas which are now well off their second quarter post-Russian invasion highs. We did increase exposure to the group as prices recovered but remain underweight.

Outlook & Positioning

Market conditions remain challenging. Inflation, Fed tightening, higher interest rates, recession fears, slowing earnings and the Russia-Ukraine war remain top of the market's mind entering 2023. The key topic remains the direction of inflation and the Fed's continued policy response. Rapidly falling inflation, a soft economic landing and an incrementally flexible Fed will be bullish developments. Stubbornly high inflation, a hard economic landing and a Fed policy mistake are the market's primary fears.

Yet this period of uncertainty offers opportunity. Positively, valuations have declined for our portfolio as we see many holdings trading at attractive discounts versus their own history. Micro/small cap stocks in general continue to trade at a deep discount versus large caps, the second largest discount in 40 years. Importantly, current small cap valuations are at levels similar to past recessions. While the odds of a recession have materially increased, this is a widely anticipated recession that the market has been discounting for about a year.

In terms of portfolio positioning, we have an attractive mix of secular and cyclical growth holdings. By sector, industrials is our largest absolute weight, followed by technology, healthcare, consumer discretionary, financials, consumer staples, energy, communication services and materials. Relative to the benchmark, the strategy is overweight industrials, technology, communication services, consumer staples and consumer discretionary. The strategy is underweight materials, healthcare, financials and energy.

Overall, we still see many dynamic investment opportunities which have attractive valuations. These holdings nicely fit our investment philosophy of companies exhibiting growth inflections, differentiation, market share gains, strong revenues and expanding profitability.

Notes // Driehaus Small/Mid Cap Growth Strategy

FIRM DEFINITION

Driehaus Capital Management LLC (DCM) is a registered investment adviser with the United States Securities and Exchange Commission (SEC). DCM provides investment advisory services using growth equity and credit strategies to individuals, organizations, and institutions. The firm consists of all accounts managed by DCM (the Company).

DCM claims compliance with the Global Investment Performance Standards (GIPS®).

COMPOSITE DESCRIPTION

The Small/Mid Cap Growth Composite was created in February 2012. An account is considered to be a small/mid cap growth account if it primarily invests in U.S. equity securities of high growth companies with market capitalization ranges at the time of purchase as those included in the Russell 2500® Growth Index between \$500 million and \$15 billion. However, there is no requirement to be exclusively invested in small cap and mid cap stocks, and the accounts have invested, to a lesser extent, in stocks with a smaller or larger capitalization from time to time.

PERFORMANCE RESULTS

Net of fee returns reflect the payment of advisory fees and in some instances, other fees and expenses such as administrative and custodian fees while the gross of fee returns do not. Both are net of brokerage commissions charged to the accounts and reflect the reinvestment of income and other earnings.

Valuations and returns are computed and stated in U.S. dollars. Returns are presented on a pretax basis.

Past performance is not indicative of future results. All investments have risks and you could lose money.

Additional information regarding policies for valuing investments, calculating performance and preparing GIPS Reports are available upon request. A list of composite descriptions and a list of broad distribution pooled funds are available upon request. Please contact our sales, marketing and relationship management department at 312-932-8621.

RISKS

All investments have risks. At times, a significant portion of an account's return may be attributable to investments in initial public offerings (IPOs) or concentrations in certain strong performing sectors, such as technology. Returns from IPOs or sector concentrations may not be repeated or consistently achieved in the future. In addition, participating in IPOs and other investments during favorable market conditions may enhance the performance of a strategy with a smaller asset base, and the strategy may not experience similar performance results as its assets grow. The securities of micro-cap companies may be more volatile in price, have wider spreads between their bid and ask prices, and have significantly lower trading volumes than the securities of larger capitalization companies. As a result, the purchase and sale of more than a limited number of shares of the securities of a smaller company may affect its market price. Growth stocks may involve special risks and their prices may be more volatile than the overall market. It is anticipated that the strategy will experience high rates of portfolio turnover.

INDICES

The Russell 2500® Growth Index measures the performance of the small to midcap growth segment of the U.S. equity universe. It measures the performance of those Russell 2500® Index companies with higher growth earning potential as defined by FTSE Russell's leading style methodology. Data includes reinvested dividends.

Frank Russell Company ("Russell") is the source and owner of the trademarks, service marks and copyrights related to the Russell Indexes. Russell® is a trademark of Frank Russell Company. TERMS

Active share represents the share of portfolio holdings that differ from the benchmark index holdings. **Beta** is a measure of a portfolio's volatility. A beta of 1.00 implies perfect historical correlation of movement with the market. A higher beta manager will rise and fall more rapidly than the market, whereas a lower beta manager will rise and fall slower. **Information Ratio (IR)** measures a portfolio manager's ability to generate excess returns relative to a benchmark, but also attempts to identify the consistency of the investor. This ratio will identify if a manager has beaten the benchmark by a lot in a few months or a little every month. The higher the IR the more consistent a manager is and consistency is an ideal trait. **R-Squared** is a statistical measure that represents the percentage of a fund or security's movements that can be explained by movements in a benchmark index. For fixed-income securities, the benchmark is the T-bill. For equities, the benchmark is the S&P 500. **Standard Deviation** is a measure of the average deviations of a return series from its mean; often used as a measure of portfolio volatility. A large standard deviation implies that there have been large swings or volatility in the manager's return series. **Tracking Error** is a divergence between the price behavior of a position or a portfolio and the price behavior of a benchmark. This is often in the context of a hedge or mutual fund that did not work as effectively as intended, creating an unexpected profit or loss instead.
