

Driehaus Micro Cap Growth Strategy Summary

2ND QUARTER 2023

Market Overview

The June quarter saw broad gains for U.S. equities led by the mega-cap tech stocks. Despite fears of an economic slowdown, the threat of a recession, and a regional bank crisis, the market was resilient as the Nasdaq posted its strongest first half of the year since 1983 and gained 32%. That strength broadened out to other sectors and to smaller market caps in the month of June.

The Russell small cap indices were down slightly during the first two months of the quarter. Small caps then played catch up in June, slightly outperforming large caps by gaining about 8% in the final month. Positively, this marked the third straight positive quarter for the US equity market. Notably, since 1950, such a streak has only occurred during bull markets.

The leadership during the quarter was encouraging and bullish. Economically sensitive cyclical industries and secular growth companies outperformed while defensive groups lagged. Technology (particularly semiconductors), industrials, transports, homebuilders and consumer leisure groups led during the quarter. These groups typically represent bull market leadership. Defensive areas like staples, parts of health care and utilities all lagged. Energy and materials lagged, which is a positive sign for disinflation. Banks, however, are an important market bellwether group, and they continue to lag badly. Small cap leadership, while much improved in the month of June, continues to lag large cap performance since the October 2022 S&P 500 low. Three quarters into a rally, small cap leadership is typically much more evident.

From a macro perspective, the U.S. economy continues to grow and there are no immediate signs of a recession, thus far. The labor market remains very resilient with strong job growth. Key areas like construction and homebuilding are showing clear strength. The auto sector is recovering. Leisure spending, travel and services remain a source of expansion as post-Covid demand shows few signs of abating.

These areas of strength are surprising to some given the Fed's restrictive monetary policy and the 500 plus basis point increase in the Federal Funds rate since March of last year. A recession has been widely expected by market participants as the traditional indicators of a recession suggest one should occur. Despite this risk of a recession, equities have been strong year-to-date as the rate of inflation continues to decline and economic growth remains positive (non-recessionary). The macro environment remains mixed with many conflicting variables. The market outlook can be summarized into two potential scenarios:

A recession is still in front of us – several reliable indicators suggest a recession is just a matter of time:

• Traditionally, an inverted yield curve, especially one this sharply inverted, very consistently leads to a recession (see the chart below). It is well established, but often forgotten, that monetary policy works on a long, variable lag. A recession typically occurs 12-18 months after the initial inversion of the curve. While distinct parts of the curve inverted at different times, using the widely followed 2-10 year curve, which inverted last July, history suggests the long anticipated US recession is still (loosely) one to three quarters away.

The state of the s

Exhibit 1: Yield curve inversions consistently precede recessions

Source: FRED (the Federal Reserve Bank of St Louis)

- The very large increase in the Fed Funds Rate historically results in a recession. The increase thus far is the second largest in history at 500 plus basis points since March of 2022.
- Declining LEIs (Leading Economic Indicators) historically precede a recession. The LEIs have declined 12 months in a row, and typically are a predictive variable that anticipates turning points in the business cycle by about 7 months. However, the CEIs (Coincident Economic Indicators) have not yet confirmed the LEIs. Also, global LEIs have turned back up recently, and the US has never experienced a recession when global LEIs are rising.
- This cycle's missing recession ingredient thus far is a contraction in credit via a credit crisis. Many expected the regional bank crisis in March to create such a credit crisis. It did not. Others expect a crisis to stem from the very unfavorable fundamentals in the office segment of the commercial real estate market or in the weakening of the sub-prime consumer credit market. These are still areas to monitor but a crisis has not happened yet. A credit crisis could also come from an area of the economy that is not widely expected. Given the tremendous liquidity still in the post-Covid economy it is plausible that we avoid the "needed" credit crisis to tip the economy into negative territory. While possible, such an avoidance of a credit crisis would be unique versus prior cycles given the yield curve and Fed tightening.
- As we mentioned in prior quarterly commentaries, equities historically bottom during a recession, not before. Yet equities are performing well as evidenced by three consecutive quarters of positive returns, again, something that has never happened in a bear market since 1950.
- Importantly, equities have been anticipating the impact of these traditional recession indicators and arguably priced in a recession with the dramatic market declines from the peaks of 2021 into the lows of the second quarter of 2022. At the June lows last year, micro and small cap equities had priced in a recession. Please see the chart and a further discussion below on the attractiveness of micro/small cap valuations.

The economy has already experienced rolling recessions and now is seeing a rolling expansion.

Multiple key industries have experienced a recession over the past 18 months. As these downturns occurred at different intervals they didn't tip the economy into a recession in aggregate terms and now many of them appear to be in expansion mode.

- Tech went through a downturn last year with large layoffs stemming from the sector's excesses during Covid. Many parts of the tech sector are now recovering and EVs and AI (artificial intelligence) are seen as important new openended growth drivers for the sector.
- Single-family residential housing went through a downturn last year as mortgage rates more than doubled. Residential investment fell 23% from Q2-2021 through Q1-2023. Consumers and builders have adjusted to the higher rates and lower measures of affordability with home sales and production accelerating year to date.
- The auto sector went through a downturn as production fell due to unprecedented semiconductor shortages. U.S. auto production bottomed at 12.5m units (SAAR annualized) in late 2021 and has been recovering since mid-2022 as chip production normalizes and demand remains healthy.
- Manufacturing is amid a downturn with the ISM PMI (Purchasing Managers Index) hitting the mid-40's range earlier this
 year. Yet there are many indicators to suggest that manufacturing will recover as the reshoring trend continues to grow
 and construction spending is robust.
- Travel and leisure spending went through a dramatic decline during Covid but since has recovered and current demand seems sustainable looking at current trends and surveys.
- Durable goods spending experienced a sharp downturn post-Covid as the sector saw a hangover from record durable goods expenditures by consumers during the pandemic which peaked in late 2021. It has since stabilized and actually rose by a double digit % in the March quarter.

Naturally, many risks and uncertainties remain but there is a credible case to be made that the traditional recession indicators may need to be interpreted differently this cycle given the particulars of a post-pandemic recovery versus the traditional supply/demand/credit crisis economic cycle. We are not making a call for or against a recession but rather are pointing out current observations and historical tendencies. There have been many periods historically where the market rallied before a recession and during yield curve inversions, only to have the rally fail later. Either way the current variables are in many ways unique when compared to past cycles.

Valuation – whether or not a recession occurs, it is possible the market priced in a contraction in economic activity and lower earnings as of June 2022.

- The Russell 2000 reached low double digit forward P/E level in June of 2022. That is at or below the level reached during the past five recessions.
- Small caps trade at a deep discount to large caps—the second largest discount ever since the inception of the Russell 2000 in 1980 as illustrated in the following chart.

Exhibit 2: Small Caps Remain Historically Cheap vs. Large Caps

Source: BofA US Equity & Quant Strategy, FactSet

Even excluding the eight mega-cap tech stocks, small caps trade at a unique historical discount to large caps:

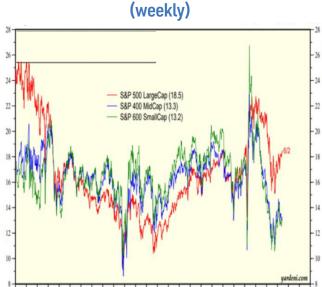

Exhibit 3: Forward P/E Ratios for S&P Indexes* (weekly)

Exhibit 4: Forward P/E Ratios* of S&P with and without MegaCap-8**

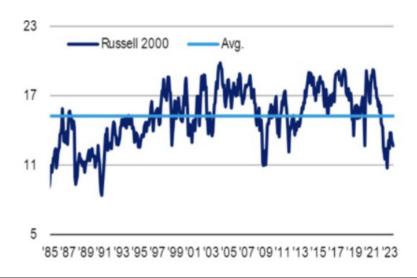

^{*}Price divided by 52-week forward consensus expected operating earnings per share Source: Yardeni

^{*}Price divided by consensus forward earnings forecast

^{**}MegaCap-8 stocks include, Alphabet, Amazon, Apple, Meta, Microsoft, Netflix, NVIDIA, and Tesla. Both classes of Alphabet are included. Source: I/B/E/S data by Refinitiv Source: Yardeni

- As a sign of large cap dominance, it is notable that:
 - -Apple's (AAPL) market cap exceeds the market cap of the entire Russell 2000.
 - -JP Morgan's (JPM) market cap exceeds the entire S&P Regional Bank index's market cap.
- Small caps typically outperform large caps for the first five to six years of a new bull market cycle when looking at the past several decades. It is well known that small caps underperform during bear markets, but given the bear market began in 2021, it is important to look forward and consider how small caps outperform traditionally in a new market cycle.
- The small cap Russell 2000 declined 32.43% from its high on November 8th in 2021 to its low on June 16th of 2022. The Russell 2000 Growth index declined 41.93% from its high on February 8th, 2021, to its low on June 16th of 2022. At these June lows, small caps reached valuations consistent with or below prior recession lows. Small Caps have only recovered modestly but historically as new equity cycles unfold, valuation multiples normalize and often recover guickly. Consider the following chart:

Exhibit 5: Small Cap Forward P/E Below the Long-Term Average

Source: BofA US Equity & Quant Strategy, Factset

Key themes:

AI (Artificial Intelligence):

Al is still in its infancy. We believe it will have a significant impact on our economy and create many investment opportunities. However, its true impact will take some time to be known. Some companies have been working on integrating Al into their products and services for a while now. The hype surrounding Al has reached an elevated level since the introduction of ChatGPT late in 2022. A lot of that hype may prove to be unwarranted. In some use cases and industries, Al may prove to be a commodity. In others, it may be a major differentiator.

We are constantly assessing which stocks and industries may be beneficiaries and which may be disrupted or may be at a disadvantage when it comes to Al. Some stocks are benefitting from hype and others are seeing multiple compression due to Al risks. We do not hold any Al pure play companies yet; very few are public at this juncture. However, we do hold several attractive companies benefiting from Al.

Housing:

Despite the negative impact of higher interest rates on housing affordability, homebuilders and building materials stocks have been outperforming since late 2022. The strength in the broader homebuilding group is being driven by several factors:

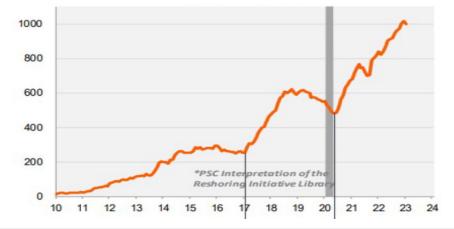

- The US has been under-building single family residential homes for over 15 years relative to population and housing formation growth, creating a severe shortage of homes. By some estimates this equates to a shortage of 6 million homes nationwide.
- 90% of US home mortgages have a rate under 5%. Over the past 18 months, the typical mortgage rate has ballooned from under 3% to over 7%. As a result, many existing homeowners do not want to sell as they would end up with a much higher new mortgage rate. This is creating a shortage of existing homes for sale and pushing buyers into the new home market.
- Millennials, now the largest generation by population, are buying homes for the first time. Older generations and more affluent households are increasingly purchasing vacation or second homes as remote and hybrid work is becoming more acceptable and there is a migration from high tax to low tax states. These dynamics are driving housing demand despite high rates and unfavorable affordability.

The end result is a robust environment for new home construction. Newly built homes are now 30-35% of all homes sold versus the historical 10-15% range. Also, the public homebuilder companies have key advantages over the thousands of smaller local builders. They have huge scale to manage this demand, acquire land, leverage costs, get attractive financing and can buy down mortgage rates providing buyers with a deep discount (in the 5% range) to where typical mortgage rates currently reside.

Reshoring:

Reshoring is the trend of manufacturing returning to the US from other parts of the world. It is the result of the huge supply chain dislocations and headaches experienced during Covid. Additionally, rising costs, negative rhetoric and less friendly policy in China are also key factors. National security and energy security issues are also supporting the move to relocate domestically. The reshoring trend actually began well before Covid but has accelerated since then. Note the large rise in the number of announced projects and the huge increase in construction spending on new manufacturing facilities shown in the following two charts.

Exhibit 7: Nonresidential Construction: Manufacturing (billion dollars, saar)

Source: Yardeni

A further driver of reshoring is the exceptionally large federal stimulus plans that are encouraging manufacturing to return domestically. These include the Inflation Reduction Act (IRA), the Infrastructure Investment and Jobs Act, the Chips Act, and various rural broadband spending programs which combined total more than \$2 trillion in spending, subsidies, or credits over the next decade. We believe this is a powerful multi-year theme that many industrial and tech companies are benefitting from. We are increasingly seeing reshoring begin to impact current demand for many industrial holdings and reshoring is being mentioned more frequently as a fundamental driver of quarterly results. It is one driver of our overweight position in the industrial sector.

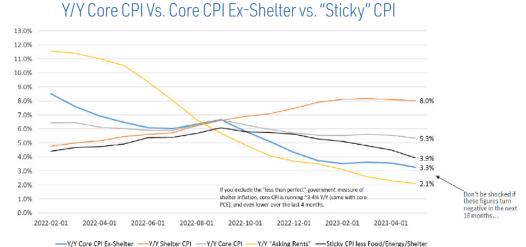

Inflation:

Inflation remains the key macroeconomic variable. Inflation has been the primary cause of the 2021 market peak and ensuing bear market. Naturally, inflation has driven the Fed's hawkish monetary policy and as a result the economic and earnings slowdown. US inflation peaked in June of 2022 and has consistently declined since on a year-over-year basis. While still not at the Fed's 2% target, we continue to believe inflation is trending in the right direction as the four key Covid-related drivers of inflation continue to ease or normalize:

- Money supply (M2) was up 27% y/y in 2021 and is now down around 5% y/y.
- Excess saving has normalized and returned to pre-Covid levels.
- Supply chain issues have normalized.
- Labor shortages labor demand has eased, labor participation (supply) is recovering, and wage growth is falling.

Some observers believe that inflation will remain sticky and the remaining path to 2% will prove difficult to achieve. Perhaps, but looking at the various components of CPI (Consumer Price Index) a path to 2% remains clear. For instance, the shelter/housing components of the official CPI are calculated on a lag. When looking at more real time indicators of shelter/housing inflation they are well below the official CPI numbers and trending lower favorably. The following helps illustrate this dynamic.

Exhibit 8: Inflation is Improving, and Will Continue to as Supply Increases, Demand Decreases

Source: St. Louis Federal Reserve, Raymond James Research

Performance Review

For the June quarter, the Driehaus Micro Cap Growth strategy outperformed its benchmark. The Strategy gained 9.44%, net of fees, while the Russell Micro Cap Growth Index gained 6.35%., the Russell Micro Cap index rose 5.29%, the Russell 2000 appreciated 5.21%, and the S&P 500 rose 8.74%. By month, the Strategy outperformed in each of the three months.

By sector, the June quarter performance is summarized as follows:

Outperforming sectors:

Health Care

Healthcare outperformed by a strong 222 basis points vs the benchmark, largely due to security selection. Our healthcare holdings gained 20.6% versus 12.9% for the benchmark and contributed 680 basis points to the strategy's absolute performance for the quarter. Outperformance in biotech/pharma and medical devices drove the positive relative and absolute performance. Healthcare is the portfolio's largest absolute sector weight, ending the quarter at 33.5% vs 31.5% at the start of the quarter. The sector ended the quarter underweight the index by 242 basis points. Biotech/Pharma holdings outperformed the benchmark by 221 basis points and contributed 578 basis points in absolute terms. The outperformance was driven by strong gains in individual stocks with encouraging clinical trial results, clinical pipeline updates and M&A. Our holdings have very promising and innovative clinical stage therapies demonstrating superior efficacy, safety and/or dosing in important disease indications such as epilepsy, endocrinology, diabetes, neurology, autoimmune, vaccines and oncology. We anticipate the second half of 2023 will be a promising period for many of them as their clinical trials demonstrate successful outcomes.

'The performance data represents the strategy's composite of micro cap growth accounts managed by Driehaus Capital Management LLC (DCM). These returns are estimated for the period as the underlying accounts' data is yet to be reconciled to the custodian bank. Net of fee returns reflect the payment of advisory fees and in some instances, other fees and expenses such as administrative and custodian fees while the gross of fee returns do not. Both are net of brokerage commissions charged to the accounts and reflect the reinvestment of income and other earnings. The performance data shown above represents past performance and does not guarantee future results. Current performance may be lower or higher than the performance data quoted.

It was also a busy period for M&A. We had five biotech holdings get acquired during the quarter. Four were acquired by big pharma companies and one by a small cap biotech company. We believe this heightened level of M&A is a reflection of the companies having innovative therapeutic pipelines, larger pharma companies having robust commercial infrastructures to commercialize these drugs once approved, big pharma's growing need to offset future patent cliffs as well as attractive valuations throughout the industry. While these were favorable outcomes for performance this quarter, in most of these cases we anticipated far greater upside had these companies let their clinical pipelines mature further.

Medical devices also performed well as a handful of holdings continue to have robust commercial product launches as demonstrated by strong quarterly surprises and forward outlooks. Strong performers during the quarter are providing better patient outcomes in areas such as organ transplants, sleep apnea, orthopedics, and various ophthalmology diseases.

Consumer Staples

Staples outperformed the index by 102 basis points due to security selection and contributed 134 basis points in absolute terms. Our holdings rose 15.7% for the quarter, strongly outperforming the benchmark's holdings, which declined 2.5%. The sector's outperformance came from a handful of stocks. One being a cosmetic/beauty supplier, which reported 78% revenue growth, 223% earnings growth and an impressive earnings surprise and guidance raise, resulting in a 39% stock gain. Two specialty beverage companies gained 60% and 38%, respectively, while posting strong earnings surprises. These gains and others were offset by modest declines in a couple food and beverage holdings. We continue to maintain an overweight in the sector due to the attractiveness of multiple holdings with strong brands which are gaining share in large markets.

Industrials

Industrials added 45 basis points in relative terms and 184 basis points in absolute terms. Our holdings rose 10.4% versus 8.2% for the index. The portfolio remains overweight the sector at 18.5% (up 120 basis points since the start of the quarter) versus 14.6% for the index. We maintain an overweight as we see attractive holdings and several strong end market themes within the sector. These themes include reshoring (discussed above), commercial aerospace, residential housing, and non-residential construction.

Materials

The materials sector outperformed by 41 basis points, largely due to stock selection. Our holdings rose 9.3% versus negative 4.5% for the benchmark's holdings. Our outperformance was from commercial aerospace specialty metal suppliers. Overall, however, the materials sector remains challenging, and we maintain an underweight stance.

Financials

Financials outperformed by 35 basis points due to being underweight the sector. Our holdings did decline 1.05% for the quarter, exactly in-line with the benchmark's holdings. The underweight position was largely due to being underweight banks, with a 1.1% weighting versus 3.5% for the index. Our bank holdings gained nearly 7% while the index stabilized, finishing down nearly 3%. Our relative bank sub-industry outperformance equaled 36 basis points. Over the medium and long-term we believe the tremendous price declines in the banking group will provide attractive opportunities. However, we remain cautious on the group near-term as several challenges and uncertainties remain though the regional banking crisis of confidence has calmed down.

Energy

Energy continued to be challenging, as the price of crude oil and natural gas were weak pressuring the sector. The sector modestly outperformed by 17 basis points due to being underweight the sector. Our holdings gained 3.1%, nearly in-line with the index's 3.6% sector gain. The sector was relatively stable, in the context of it being the market's best performing sector last year and the worst performing sector in the first quarter. We increasingly like the group long-term as under-investment in capex and production suggest higher crude and natural gas prices. Near-term, the one bright spot is oil service and equipment companies with offshore exposure. Offshore oilfield activity is increasing, leading to higher equipment demand, rising day rates, and strong earnings outlooks.

Consumer Discretionary

Consumer discretionary has been a volatile sector over the past couple of years but was relatively stable during the quarter though it underperformed the broader equity market. Our holdings performed essentially inline gaining 1.9% versus 1.4% for the index. We did see strength in auto suppliers, restaurants, and homebuilders. This strength was almost offset by the decline in a fitness boutique franchisor. This position has been a positive contributor since its 2021 IPO. However, the position initially pulled back during the quarter after it posted a strong earnings report, likely due to elevated expectations, and then in late June the stock fell further as a short report attacked it. We believe the short report was not valid and highly speculative, but the stock fell nonetheless, and it should recover.

Overall, the outlook for the consumer remains mixed as excess Covid savings decline and low to middle income households become incrementally more cautious with their spending. Still in aggregate terms consumer spending is positive as the labor market remains robust, inflation slows and pent-up demand for post-Covid leisure and travel remains evident. Homebuilders remain strong as we discussed above. We maintain a slight overweight in the sector with a 12% weighting, consistent with a quarter ago.

Underperforming sectors:

Technology

Technology added a slim 6 basis points to absolute performance but detracted 74 basis points versus the index as our holdings underperformed, gaining .8% vs 4.3% for the index. Unlike the dominating performance by mega-cap tech and the Nasdaq, many smaller tech stocks took the quarter off. By sub-industry, software and IT services pulled back, while semiconductors were mixed, and telco equipment began to bounce back.

Semiconductors are our biggest industry exposure within tech. After the December and March quarters saw robust outperformance in semis, we expected some consolidation. We continued to see strong gains and earnings from two semi cap equipment holdings levered to silicon carbide (SiC) material adoption in EVs (electric vehicles). However, one of our strongest performers over the past year (an RFID (radio-frequency identification) chip supplier), declined sharply as it had to reduce near-term guidance as a couple of large customers delayed RFID project rollouts. We had believed its very large backlog and robust demand would make the risk and impact of customer delays low, but clearly the company is still exposed to the risk of uneven large customer adoption.

We maintain a slight overweight to the tech sector, but that exposure declined 140 basis points since the end of the March quarter, finishing at a 19.4% weighting.

Communicatin Services

Communications services is a small sector, but it detracted 60 basis points in relative terms and 70 basis points on an absolute basis. Two positive positions were more than offset by a couple declining positions. One marketing-related company declined sharply as its largest customer surprisingly pulled back on its advertising spending, creating downward earnings for the next couple of quarters. Another declining stock pulled back during the quarter after being overbought as it was a leading positive contributor in the prior two quarters.

Outlook & Positioning

Current market conditions are uncertain mixed over the near-term, as inflation, Fed monetary policy and recession concerns remain the key focus for market participants. Yet we are seeing encouraging signs across many industries and individual holdings. The technical action across the equity market is improving as it broadens out. Valuations remain appealing for many parts of the market and are significantly so when compared to large caps. As detailed above, smaller cap stocks in general continue to trade at their second largest discount to large caps over the past 40 years. Additionally, current small cap valuations are at levels similar to past recessions. While the case for a recession has conflicting variables for and against, the market has been discounting a recession for over a year. Intermediate term, the case for micro/small caps stocks is very compelling as history shows that micro/small caps typically materially outperform during the first five years or more of a new market cycle.

In terms of portfolio positioning, we have an attractive mix of secular and cyclical growth holdings. By sector, healthcare is our largest absolute weight, followed by industrials, technology, consumer discretionary, consumer staples, financials, energy, and materials. On a relative basis, the strategy is overweight industrials, consumer staples, technology, and consumer discretionary. The strategy is underweight health care, financials, and energy.

Overall, we still see many dynamic investment opportunities. Fundamentally these holdings fit our investment philosophy well as they are companies exhibiting growth inflections, with important differentiation, market share gains, strong revenues and expanding profitability.

The Russell Microcap® Growth Index measures the performance of those Russell Microcap® companies with higher price-to-book ratios and higher fore-casted growth values. The Russell Microcap® Index is represented by the smallest 1,000 securities in the small cap Russell 2000® Index plus the next 1,000 securities. An investor cannot invest directly in an index. Other refers to securities not recognized by FactSet.

Frank Russell Company ("Russell") is the source and owner of the trademarks, service marks and copyrights related to the Russell Indexes. Russell® is a trademark of Frank Russell Company. Per FactSet Research Systems Inc., the attribution report provides an in-depth analysis of relative performance. With this report one can research whether or not a portfolio outperformed a benchmark, and how each group contributed to performance. The performance data shown above is estimated and represents past performance and does not guarantee future results. Current performance may be lower or higher than the performance data quoted. The information presented is intended for informational purposes only.

ATTRIBUTION ANALYSIS CATEGORIES ARE DEFINED AS:

Allocation Effect - Measures the impact of the decision to allocate assets differently than those in the benchmark.

Security Selection Effect - Measures the effect of choosing securities, which may or may not outperform those of the benchmark.

Interaction Effect - Jointly measures the effect of allocation and selection decisions.

Total Effect - The Total Effect for each MSCI/GICS Sector is equal to the sum of the individual Attribution Effects for that MSCI/GICS Sector.

Notes // Driehaus Micro Cap Growth Strategy

FIRM DEFINITION

Driehaus Capital Management LLC (DCM) is a registered investment adviser with the United States Securities and Exchange Commission (SEC). DCM provides investment advisory services using growth equity and credit strategies to individuals, organizations, and institutions. The firm consists of all accounts managed by DCM (the Company).

DCM claims compliance with the Global Investment Performance Standards (GIPS®).

COMPOSITE DESCRIPTION

The Micro Cap Growth Composite was created in January 1996. An account is considered to be a micro cap growth account if it primarily invests in U.S. equity securities of growth companies with market capitalization ranges of generally followed micro cap indices at the time of purchase. However, there is no requirement to be exclusively invested in micro cap stocks, and the accounts have invested, to a lesser extent, in stocks with a larger capitalization from time to time.

PERFORMANCE RESULTS

Net of fee returns reflect the payment of advisory fees and in some instances, other fees and expenses such as administrative and custodian fees while the gross of fee returns do not. Both are net of brokerage commissions charged to the accounts and reflect the reinvestment of income and other earnings.

Valuations and returns are computed and stated in U.S. dollars. Returns are presented on a pretax basis.

Past performance is not indicative of future results. All investments have risks and you could lose money.

Additional information regarding policies for valuing investments, calculating performance and preparing GIPS Reports are available upon request. A list of composite descriptions and a list of broad distribution pooled funds are available upon request. Please contact our sales, marketing and relationship management department at 312-932-8621.

RISKS

All investments have risks. At times, a significant portion of an account's return may be attributable to investments in initial public offerings (IPOs) or concentrations in certain strong performing sectors, such as technology. Returns from IPOs or sector concentrations may not be repeated or consistently achieved in the future. In addition, participating in IPOs and other investments during favorable market conditions may enhance the performance of a strategy with a smaller asset base, and the strategy may not experience similar performance results as its assets grow. The securities of micro-cap companies may be more volatile in price, have wider spreads between their bid and ask prices, and have significantly lower trading volumes than the securities of larger capitalization companies. As a result, the purchase and sale of more than a limited number of shares of the securities of a smaller company may affect its market price. Growth stocks may involve special risks and their prices may be more volatile than the overall market. It is anticipated that the strategy will experience high rates of portfolio turnover.

INDICES

The Russell Microcap Growth® Index measures the performance of the microcap growth segment of the U.S equity universe. It includes those Russell Microcap® companies that are considered more growth oriented relative to the overall market as defined by FTSE Russell's leading style methodology.

TERMS

Active share represents the share of portfolio holdings that differ from the benchmark index holdings. Alpha is the measure of performance on a risk-adjusted basis. Alpha takes the volatility (price risk) of a mutual fund and compares its risk-adjusted performance to a benchmark index. The excess return of the fund relative to the return of the benchmark index is a fund's alpha. Beta is a measure of a portfolio's volatility. A beta of 1.00 implies perfect historical correlation of movement with the market. A higher beta manager will rise and fall more rapidly than the market, whereas a lower beta manager will rise and fall slower.

Information Ratio (IR) measures a portfolio manager's ability to generate excess returns relative to a benchmark, but also attempts to identify the consistency of the investor. This ratio will identify if a manager has beaten the benchmark by a lot in a few months or a little every month. The higher the IR the more consistent a manager is and consistency is an ideal trait. R-Squared is a statistical measure that represents the percentage of a fund or security's movements that can be explained by movements in a benchmark index. For fixed-income securities, the benchmark is the T-bill. For equities, the benchmark is the S&P 500. Sharpe Ratio is calculated by finding the portfolio's excess return and then dividing by the portfolio's standard deviation. Standard Deviation is a measure of the average deviations of a return series from its mean; often used as a measure of portfolio volatility. A large standard deviation implies that there have been large swings or volatility in the manager's return series. Tracking Error is a divergence between the price behavior of a position or a portfolio and the price behavior of a benchmark. This is often in the context of a hedge or mutual fund that did not work as effectively as intended, creating an unexpected profit or loss instead.
